# 1 Software

We use the statistical software environment *R* (R Core Team, 2024), and R add-on packages *ggplot2* (Wickham, 2016), and *arm* (Gelman & Su, 2024).

This document is produced using *Quarto* (Allaire et al., 2024).

## 1.1 Organize R Session

```
rm(list = ls())  
library("ggplot2")
```

## 2 Linear Regression Model

Data are simulated according to the equations given in the lecture slides<sup>1</sup>:

```
set.seed(123)  
N <- 500  
df <- data.frame(x_1 = runif(n = N),  
                 x_2 = runif(n = N))  
(beta_0 <- rnorm(n = 1, mean = 1, sd = .1))  
  
[1] 0.9398107  
  
(beta_x_1 <- rnorm(n = 1, mean = 1, sd = .1))  
  
[1] 0.9006301  
  
(beta_x_2 <- rnorm(n = 1, mean = -.5, sd = .1))  
  
[1] -0.3973215  
  
(sigma <- rgamma(n = 1, shape = 1, rate = 4))  
  
[1] 0.293026
```

---

<sup>1</sup>For two covariates  $x_1$  and  $x_2$ .

```
df$mu <- beta_0 + beta_x_1 * df$x_1 + beta_x_2 * df$x_2
df$y <- df$mu + rnorm(n = N, mean = 0, sd = sigma)
```

```
ggplot(data = df, aes(x = x_1, y = x_2)) +  
  geom_point()
```

Figure 1: Scatterplot of the two simulated covariates  $x_1$  and  $x_2$  - each from the uniform distribution between 0 and 1.
